

**Assignment -1**  
Python Programming

Assignment Date	19 September 2022
Student Name	MANOJKUMAR T
Student Roll Number	820419104032
Maximum Marks	2 Marks

**Question-1:**

Consider a list (list = []). You can perform the following commands:

insert i e: Insert integer at position .

print: Print the list.

remove e: Delete the first occurrence of integer .

append e: Insert integer at the end of the list.

sort: Sort the list.

pop: Pop the last element from the list.

reverse: Reverse the list.

Initialize your list and read in the value of followed by lines of commands where each command will be of the types listed above. Iterate through each command in order and perform the corresponding operation on your list.

**Solution:**

```
if __name__ == '__main__':
    N = int(input())
    L=[];
    for i in range(0,N):
        Cmd=input().split();
        if cmd[0] == "insert":
            L.insert(int(cmd[1]),int(cmd[2]))
        elif cmd[0] == "append":
            L.append(int(cmd[1]))
        elif cmd[0] == "pop":
            L.pop();
        elif cmd[0] == "print":
            print(L)
        elif cmd[0] == "remove":
            L.remove(int(cmd[1]))
        elif cmd[0] == "sort":
            L.sort();
        else:
            L.reverse();
```

The image shows a screenshot of a Python IDE with two windows. The left window, titled 'list1.py - E:\New folder\list1.py (3.9.10)', contains the following code:

```
if __name__ == '__main__':
    N = int(input())
    L = []
    for i in range(0, N):
        cmd = input().split()
        if cmd[0] == "insert":
            L.insert(int(cmd[1]), int(cmd[2]))
        elif cmd[0] == "append":
            L.append(int(cmd[1]))
        elif cmd[0] == "pop":
            L.pop()
        elif cmd[0] == "print":
            print(L)
        elif cmd[0] == "remove":
            L.remove(int(cmd[1]))
        elif cmd[0] == "sort":
            L.sort()
        else:
            L.reverse()
```

The right window, titled 'IDLE Shell 3.9.10\*', shows the output of the program:

```
Python 3.9.10 (tags/v3.9.10:f2f3f53, Jan 17 2022, 15:14:21) [MSC v.1929 64 bit (AMD64)] on win32

```

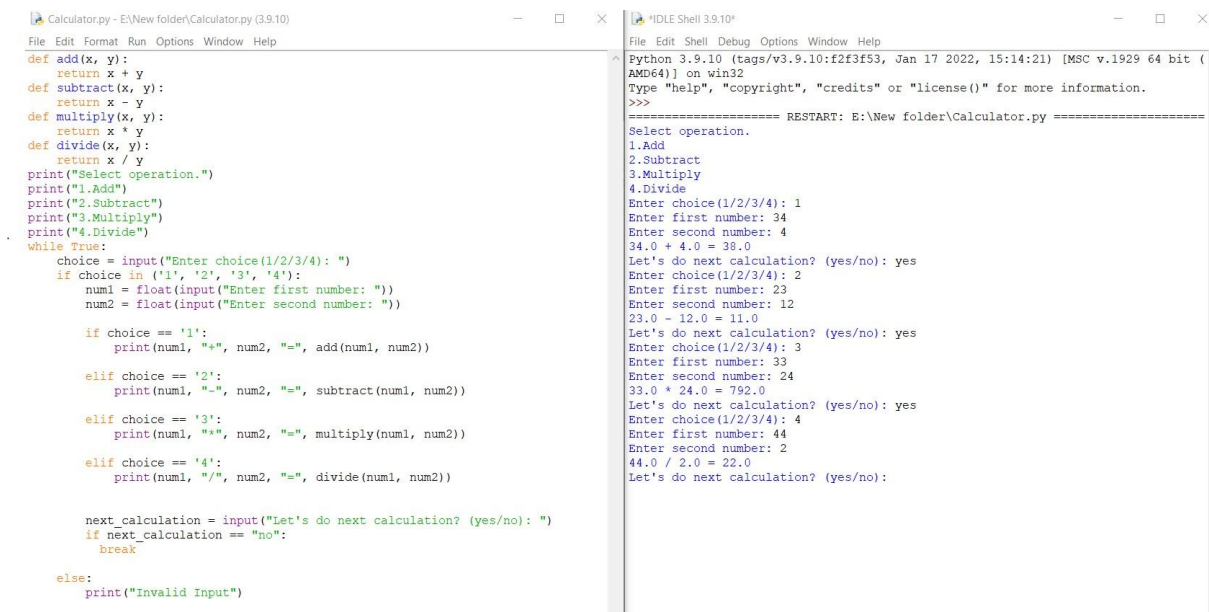

## Question-2:

Write a Calculator program in Python?

### Solution:

```
def add(x, y):
    return x + y
def subtract(x, y):
    return x - y
def multiply(x, y):
    return x * y
def divide(x, y):
    return x / y
print("Select operation.")
print("1.Add")
print("2.Subtract")
print("3.Multiply")
print("4.Divide")
while True:
    choice = input("Enter choice(1/2/3/4): ")
    if choice in ('1', '2', '3', '4'):
        num1 = float(input("Enter first number: "))
        num2 = float(input("Enter second number: "))
        if choice == '1':
            print(num1, "+", num2, "=", add(num1, num2))
        elif choice == '2':
            print(num1, "-", num2, "=", subtract(num1, num2))
        elif choice == '3':
            print(num1, "*", num2, "=", multiply(num1, num2))
        elif choice == '4':
            print(num1, "/", num2, "=", divide(num1, num2))
        next_calculation = input("Let's do next calculation? (yes/no): ")
        if next_calculation == "no":
```

```
        break
    else:
        print("Invalid Input")
```

The screenshot shows a Python IDE with two windows. The left window, titled 'Calculator.py - E:\New folder\Calculator.py (3.9.10)', contains the source code for a calculator. The code defines functions for addition, subtraction, multiplication, and division, and uses a while loop to repeatedly prompt the user for operations and numbers. The right window, titled 'IDLE Shell 3.9.10\*', shows the output of the program. It displays the menu of operations, the user's choices, the calculations performed, and the prompt to continue or stop.

Select operation.
1.Add
2.Subtract
3.Multiply
4.Divide
Enter choice(1/2/3/4): 1
Enter first number: 34
Enter second number: 4
34.0 + 4.0 = 38.0
Let's do next calculation? (yes/no): yes
Enter choice(1/2/3/4): 2
Enter first number: 23
Enter second number: 12
23.0 - 12.0 = 11.0
Let's do next calculation? (yes/no): yes
Enter choice(1/2/3/4): 3
Enter first number: 33
Enter second number: 24
33.0 * 24.0 = 792.0
Let's do next calculation? (yes/no): yes
Enter choice(1/2/3/4): 4
Enter first number: 44
Enter second number: 2
44.0 / 2.0 = 22.0
Let's do next calculation? (yes/no):
```

### Question-3:

Write a program to concatenate, reverse and slice a string?

#### Solution:

```
var1 = "Hello "
var2 = "World"
var3 = var1 + var2
print("The concatenated string:")
print(var3)
txt = "Hello World"[:-1]
print("The reversed string:")
print(txt)
txt1 = "Hello, World!"
print("The sliced string:")
print(txt1[6:11])
```

The image shows a screenshot of a Python script and its execution output. On the left, a text editor window titled 'string.py - E:\New folder\string.py (3.9.10)' contains the following code:

```
var1 = "Hello "  
var2 = "World"  
var3 = var1 + var2  
print("The concatenated string:")  
print(var3)  
txt = "Hello World"[:-1]  
print("The reversed string:")  
print(txt)  
txt1 = "Hello, World!"  
print("The sliced string:")  
print(txt1[6:11])
```

On the right, the IDLE Shell window shows the output of the script after a restart:

```
Python 3.9.10 (tags/v3.9.10:f2f3f53, Jan 17 2022, 15:14:21) [MSC v.1929 64 bit (AMD64)] on win32  
Type "help", "copyright", "credits" or "license()" for more information.

The sliced string:  
World  
>>>
```

#### Question-4:

Why is Python a popular programming language?

One of the main reasons it is popular as a programming language is that it's a great way to learn how to code. It reads almost like plain English and has many features that allow you to write complex tasks very simply. Python is a high-level programming language. Python is very easy to learn the language as compared to other languages like C, C#, Javascript, Java, etc. It is very easy to code in python language.

#### Question-5:

What are the other Frameworks that can be used with python?

Django  
Pyramid  
Circuits  
Flask  
Cherrypy  
TurboGears  
Web2py

#### Question-6:

Full form of WSGI?

WSGI refers to Web Server Gateway Interface. WSGI plays a vital role at the time when deploy Django or Flask application.
